

ABSTRACT OF THE DISCLOSURE

A practice ammunition projectile comprises a head which bursts when the projectile strikes a target and contains a marking agent which optically indicates the point of impact after the head has burst. The marking agent consists of several chemical components (7, 8, 11, 12) which are each contained in separately breakable compartments (4, 5, 10, 12) within a burstable hood at the head of the projectile. When said compartments (4, 5, 10, 12) break open the components combine and undergo a chemical reaction which creates an optical mark. The hood is formed of an optically transparent material to enable the trajectory of the projectile to be tracked.
